

Data Protection in IT

Course name:	Data Protection in IT
Partner:	IBM
Description:	Nowadays, the data owned by big organizations is often more valuable than the media and equipment used to store that data. During the course students will get an insight into the modern data protection methods. They will understand how much effort it takes to prevent the data loss and what are the examples of tools used in this process. The course starts with the general overview of IT infrastructure through storage concept and ends with the backup methodology and backup applications. The students can take a look on the IT world as seen from the backup administrator's perspective.
